Task Based User Testing – Weather Works

1. View today's weather summary from all providers.

2. Use Metservice to check the high and low temperatures for tomorrow.

3. Change your location for Metservice to 'Gore'.

4. Let the app reload the data from all providers.

5. Check the Location field in the results for Metservice.

6. Use Open Weather Map to check the current barometric pressure.

7. Use Weather Underground to check the wind information for this Wednesday and this Thursday. Think about whether this is easy to do or rather cumbersome.

8. Compare high and low temperatures between Metservice and Weather Underground. Think about whether this is easy to do or cumbersome.

9. Use all three providers to assess the likelihood of snow in the coming days. Again, think about whether this could be an easier process.
